Named Entities: People, Places, Organisations

This lecture

- How to refer to things
- Common elements for names
- Organising the data

On referring

Text editors have long desired to distinguish so-called "named entities" from other aspects of the text.

Until the mid-19th century highlighting names was common practice.

This practice is good for building a corpus, dictionary, or network graph.

This requires your brain, because referents can appear in several forms. E.g. *Moby-Dick*:

"Avast! gritted Ahab between his set teeth, and violently moving away, as if to avoid some passionate temptation."

"No, sir; not yet," said Stubb, emboldened, "I will not tamely be called a dog, sir."

"Then be called ten times a donkey, and a mule, and an ass, and begone, or I'll clear the world of thee!"

As he said this, Ahab advanced upon him with such overbearing terrors in his aspect, that Stubb involuntarily retreated.

Common elements for names

<rs>: referring string to any named entity. The most flexible, but not to be used if the noun is proper. Typically for "he/her," "that guy" &c.

<name> -- any lexical item recognized as a proper name

<persName>, <placeName>, <orgName>: More
precise way of representing
<name type="person"> &c.

(Carlyle, French Revolution)

```
So it was, we say, in those conquests of
<placeName>Flanders</placeName>,
thirty years ago:
but so it no longer is. Alas, much more lies sick than poor
<persName>Louis</persName>: not the
    <rs>French King</rs> only, but the
<name>French</name> Kingship; this too, after long rough
tear and wear, is breaking down. The world
is all so changed; so much that seemed vigorous has
sunk decrepit, so much that was not is
beginning to be!-Borne over the
<name>Atlantic</name>, to
the closing ear of
<persName>Louis, King</persName> by the Grace of God, what sounds are these;
muffled ominous, new in our centuries?
<placeName>Boston Harbour</placeName> is black with
unexpected Tea: behold a <name>Pennsylvanian</name> Congress gather; and ere long, on
<placeName>Bunker Hill</placeName>.
<name>DEMOCRACY</name> announcing, in rifle-volleys
death-winged, under her Star Banner,
to the tune of Yankee-doodle-doo, that
<rs>she</rs> is born, and, whirlwind-like,
will envelope the whole world!.
```

Entities

```
<person> corresponding with <persName>
<place> corresponding with <placeName> and <geogName>
<org> corresponding with <orgName> and <relation>, <event>
<object> corresponding with <objectName>
```

All other types of names are: <name type="[whatever]">

Better yet.

A more careful encoding of Carlyle's passage would distinguish the component parts of the names.

```
So it was, we say, in those conquests of <placeName</p>
       ref="https://www.geonames.org/8504924/county-of-flanders.html"
       ><region>Flanders</region></placeName>, thirty years ago: but so it no longer is. Alas, much
   more lies sick than poor <persName xml:id="l15" ref="https://www.wikidata.org/wiki/Q7738"
       >Louis</persName>: not the <rs ref="#l15">French King</rs> only, but the French Kingship;
   this too, after long rough tear and wear, is breaking down. The world is all so changed; so much
   that seemed vigorous has sunk decrepit, so much that was not is beginning to be!-Borne over the
       <geogName>Atlantic</geogName>, to the closing ear of <persName ref="#l15">Louis,
       King</persName> by the Grace of God, what sounds are these; muffled ominous, new in our
   centuries? <geogName><name>Boston</name>
        <geogFeat>Harbour</geogFeat></geogName> is black with unexpected

   ere long, on <placeName><district>Bunker Hill</district></placeName>, DEMOCRACY announcing, in
   rifle-volleys death-winged, under her Star Banner, to the tune of Yankee-doodle-doo, that she is
   born, and, whirlwind-like, will envelope the whole world!
```

Common elements for names

(Carlyle, *French Revolution*)

Textual Editing in the Digital Age

The **@ref** attribute is a standard pointer (@corresp also used, but don't worry about that).

<ple><placeName</pre> ref="https://www.geonames.org/8504924/county-of-

The <persName> has its own internal identifier and links to a Wikidata identifier.

ame>

flanders.html"><region>Flanders</region></placeN <persName xml:id="115"</pre> ref="https://www.wikidata.org/wiki/07738">Louis<

When the @ref includes a # in front of its value, that means it is an internal pointer.

<orgName>Pennsylvanian

<district>Bunker Hill</district>

Congress</orgName>

<geogName> can include constituent parts like the

/persName> <rs ref="#115">French King</rs>

proper name and the feature.

Within place names, you can also be more specific,

distinguishing between, say, regions and neighborhoods

organisation.

<geogName><name>Boston</name>

<orgName> describes a proper name for an

<geogFeat>Harbour</geogFeat></geogName>

Reference Theory

A reference is a fundamental semiotic concept. Cf. John Searle: language and direct perception of objects.

John Locke, *Essay on Human Understanding*: "All that can fall within the compass of human understanding, being either, first, the nature of things, as they are in themselves, their relations, and their manner of operation: or, secondly, that which man himself ought to do, as a rational and voluntary agent, for the attainment of any end, especially happiness: or, thirdly, the ways and means whereby the knowledge of both the one and the other of these is attained and communicated; I think science may be divided properly into these three sorts."

The reference is not the same entity as the referent (plurality of referents for a single entity).

How do we know which King Louis Carlyle was referring to? (The text includes both Louis XV and XVI.)

TEI allows you to express the distinctions between the two by standardising an identifier for the name (note the #115@xml:id in the previous example). But we also reference an authority file (in this case a Wikipedia link).

Why encode these things?

- Standardise references to the same thing. E.g. "King Louis", "Sun King", "Louis XIV", "tyrant".
- Standardise the editor's preferred description of an object or organisation.
- Always remember the importance of editorial judgment!
- Enable fine-grained searching of data-centric projects, e.g.
 - stable references to authority files and gazeteers
 - biographical dictionaries
 - geographical dictionaries
 - extracted indices

Organising Names: Prosopography

Besides simply tagging each name as we just did with Carlyle, you have three options for organising your biographical data.

- 1. Using a @key (or @ref). So, Louis XV would be <persName key="Louis XV (15 February 1710 – 10 May 1774)">Louis</persName> (not recommended IMHO!)
- 2. Put the data in the <teiHeader>: either <particDesc>, nested within the <profileDesc>, or with
- 3. Create a separate prosopography XML file using <listPerson> entries.

Organising Names: Prosopography in <teiHeader>

Henry Irving to Samuel L. Clemens 31 March 1884 • New York, N.Y. (MS: CU-MARK, UCLC 41956)

Persons Mentioned

Sir Henry Irving (1838–1905)

English stage actor Henry Irving was born John Henry Broadribb, the son of a traveling salesman in Somerset. His first professional appearance was as the Duke of Orleans in Bulwer-Lytton's Richelieu in September 1856 at the New Royal Lyceum Theatre, Sunderland. In 1871 he joined the Lyceum Theatre in London under the management of Hezekiah Bateman, where he won acclaim for his performance in The Bells, an adaptation of Erckmann-Chatrian's Le Juif Polonais. He took over the management of the Lyceum Theatre from Bateman in 1878, the beginning of his long stage and personal partnership with Ellen Terry. In 1895 he became the first actor to receive a knighthood. During a provincial farewell tour in Bradford he was taken ill and died of a stroke hours later.

What else can be included in <person> entries? Quite a lot!

- <u>faith</u> specifies the faith, religion, or belief set of a person.
- <u>langKnowledge</u> (language knowledge) summarizes the state of a person's linguistic knowledge, either as prose or by a list of <u>langKnown</u> elements.
- <u>nationality</u> contains an informal description of a person's present or past nationality or citizenship.
- **sex** specifies the sex of a person.
- <u>age</u> specifies the age of a person.
- socecStatus (socio-economic status) contains an informal description of a person's perceived social or economic status.
- <u>occupation</u> contains an informal description of a person's trade, profession or occupation.

- <u>residence</u> describes a person's present or past places of residence.
- <u>affiliation</u> contains an informal description of a person's present or past affiliation with some organization, for example an employer or sponsor.
- <u>education</u> contains a description of the educational experience of a person.
- **floruit** contains information about a person's period of activity.
- **persona** provides information about one of the personalities identified for a given individual, where an individual has multiple personalities.
- <u>state</u> contains a description of some status or quality attributed to a person, place, or organization often at some specific time or for a specific date range.
- <u>trait</u> contains a description of some status or quality attributed to a
 person, place, or organization typically, but not necessarily, independent of
 the volition or action of the holder and usually not at some specific time
 or for a specific date range.

What else can be included in name entries? Even more

- <birth> and <death> are the only specific events.
- <event> is used for recording any other kind of event (if you want to record moments like date of marriage).
- How can we connect these people?!
 Relationships: The <relation> (relationship)
 element describes any kind of relationship or linkage amongst other entities.
- Nested under any of the following groupings
 <u>listEvent listNym listObject listOrg listPerson listPlace listRelation</u>

 More on Relationships: 'mutual' (e.g. sibling) v. non-mutual or directed relationships (e.g. parent).

The following attributes are available:

- @name supplies a name for the kind of relationship of which this is an instance
- @active identifies the 'active' participants in a non-mutual relationship, or all the participants in a mutual one
- @mutual supplies a list of participants amongst all of whom the relationship holds equally
- @passive identifies the 'passive' participants in a non-mutual relationship

```
<person xml:id="SS">
    <persName>Siegfried Loraine Sassoon</persName>
</person>
<person xml:id="HG">
    <persName>Hester Gatty</persName>
</person>
<person xml:id="GS">
    <persName>George Sassoon</persName>
</person>
<! --...>
<relationGrp type="children">
    <relation name="parent" active="#SS"</pre>
        passive="#GS"/>
    <! ---->
</relationGrp>
```

TEI Places

<place>

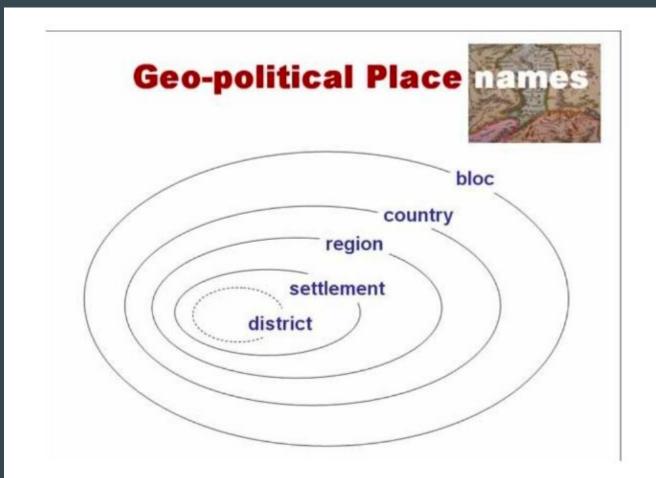

<placeName>

<bloo>

<country>

<settlement>

<district>

Places

Any place name instance should include structured information about what kind of place it is. A city is <settlement>, a neighborhood is a <district> and so on.

The <location> element can contain

- A structured description using the hierarchy of place name components mentioned earlier (a politico-geographical location)
- geographical coordinates

Places

Places: places nested within places

```
<place type="soverignState">
    <placeName>United Kingdom</placeName>
    <placeName type="full">United Kingdom of Great Britain and
       Northern Ireland</placeName>
    <place type="country">
        <placeName>Scotland</placeName>
        <place xml:id="edinburgh" type="city">
            <placeName>Edinburgh</placeName>
            <place xml:id="craiglockhart2">
                <placeName>Craiglockhart War Hospital</placeName>
                <location>
                    <geo>55.91812, -3.24019</geo>
                </location>
            </place>
        </place>
    </place>
</place>
```

Organisation data

- <orgName> is the proper name for an organisation.
- <org> provides information about an identifiable organization such as a business, a tribe, or any other grouping of people.
- listOrg> contains a list of <org> elements

```
<orgName ref="#royalist">Royalist
Camp</orgName> of Jales
```

```

13 Names, Dates, People, and Places

This chapter describes a module which may be used for the encoding of names and other phrases descriptive of persons, places, or organizations, in a manner more detailed than that possible using the elements already provided for these purposes in the Core module. In section 3.5 Names, Numbers, Dates, Abbreviations, and Addresses it was noted that the elements provided in the core module allow an encoder to specify that a given text segment is a proper noun, or a referring string, and to specify the kind of object named or referred to only by supplying a value for the @type attribute. The elements provided by the present module allow the encoder to supply a detailed sub-structure for such referring strings, and to distinguish explicitly between names of persons, places, and organizations.

This module also provides elements for the representation of information about the person, place, or organization to which a given name is understood to refer and to represent the name itself, independently of its application. In simple terms, where the core module allows one simply to represent that a given piece of text is a name, this module allows one further to represent a personal name, to represent the person being named, and to represent the canonical name being used. A similar range is provided for names of places and organizations. The main intended applications for this module are in biographical, historical, or geographical data systems such as gazetteers and biographical databases, where these are to be integrated with encoded texts.

The chapter begins by discussing attributes common to many of the elements discussed in the remaining parts of the chapter (13.1 Attribute Classes <u>Defined by This Module</u>) before discussing specifically the elements provided for the encoding of component parts of personal names (section 13.2.1 <u>Personal Names</u>), place names (section 13.2.3 <u>Piace Names</u>) and organizational names (section 13.2.5 <u>Personal Names</u>). Elements for the encoding of geographical data are discussed in section 13.3.4 <u>Places. Finally, elements for the encoding of dates and times is described in section 13.3.7 <u>Places. Finally, elements for encoding on the detailed encoding of dates and times is described in section 13.3.7 <u>Places. Finally, elements for the encoding of dates and times is described in section 13.3.7 <u>Places. Finally, elements for the encoding of dates and times is described in section 13.3.7 <u>Places. 13.1 Attribute Classes Defined by This Module

Most of the elements made available by this chapter share some important characteristics which are expressed by their membership in specific attribute classes. Members of the class att.naming have specialized attributes which support linkage of a naming element with the entity (person, place, organization) being named; members of the class att.datable have specialized attributes which support a number of ways of normalizing the date or time of the data encoded by the element concerned.

13.1.1 Linking Names and Their Referents

The class att.naming is a subclass of the class att.canonical, from which it inherits the following attributes:

att.canonical provides attributes which can be used to associate a representation such as a name or title with canonical information about the object being named or referenced.

@key provides an externally-defined means of identifying the entity (or entities) being named, using a coded value of some kind.

@ref (reference) provides an explicit means of locating a full definition or identity for the entity being named by means of one or more URIs.
